

FUJS 17.933
09/712,682In the Claims:

1. (currently amended): A mobile radio terminal comprising:

a memory storing data, received via a wireless line, having a hyperlink of telephone number information;

a data display section displaying the data stored in said memory;

an operation detecting section detecting an operation of the hyperlink in the state of the data being displayed on the data display section but no voice communication being executed;

a call control section, operative in response to the operation detection of said operation detecting section, executing a call-out process for establishing voice communication with respect to a destination terminal that is identified by the telephone number information; and

a display control section controlling said data display section to display at least a part of the data having the hyperlink, while at least one of executing the call-out process and executing voice communication with the destination terminal by said call control section.

2. (previously presented): A mobile radio terminal according to claim 1, wherein said display control section is equipped with redisplay control means, responsive to the start of the call-out process execution by said control section, for controlling said data display section to display a calling-out state and then redisplay the data.

3. (original): A mobile radio terminal according to claim 2, wherein the redisplaying of the data by said redisplaying control means is performed in response to a display changeover operation after displaying the calling-out state.

FUJS 17.933
09/712,682

4. (original): A mobile radio terminal according to claim 2, wherein the redisplaying of the data by said redisplaying control means is performed in response to a change to a voice-communication state after displaying the calling-out state.

5. (currently amended): A mobile radio terminal comprising:

a memory storing data, received via a wireless line, having attached a hyperlink of telephone number information;

a data display section displaying the data stored in said memory;

an operation detection section detecting an operation of the hyperlink in the state of the data being displayed on said data display section but no voice communication being executed;

a call control section, operative in response to the operation detection of said operation detecting section, executing a call-out process for establishing voice communication with respect to a destination terminal that is identified by the telephone number information; and

a combination display control section, while at least one of executing the call-out process and executing voice communication with the destination terminal, controlling said data display section to provide a combination display state in which said data display section displays in combination at least a part of the data having the hyperlink and a calling-out state.

6. (currently amended): A method of displaying data on a mobile radio terminal, comprising the steps of:

(a) detecting an operation of a hyperlink of telephone number information of data, received via a wireless line, in the state of the data being displayed on a data display section of the mobile radio terminal but no voice communication being executed;

FUJS 17.933
09/712,682

(b) upon detection of the operation in step (a), executing a call-out process for establishing voice communication with respect to a destination terminal that is identified by said telephone number information; and

(c) while at least one of said executing of the call-out process in step (b) and executing voice communication with the destination terminal, displaying at least a part of the data having the hyperlink on the data display section.

7. (original): A data display method according to claim 6, wherein step (c) includes:

(c1) in response to the start of said executing of the call-out process, displaying a calling-out state on the data display section; and

(c2) redisplaying the data on the data display section after said displaying in step (c1).

8. (original): A data display method according to claim 7, wherein said redisplaying in step (c2) is performed in response to a display changeover operation after said displaying in step (c1).

9. (original): A data display method according to claim 7, wherein said redisplaying in step (c2) is performed in response to a change to a voice-communication state after said displaying in step (c1).

10. (currently amended): A method of displaying data on a mobile radio terminal, comprising the steps of:

FUJS 17.933
09/712,682

(a) detecting an operation of a hyperlink of telephone number information of data, received via a wireless line, in the state of the data being displayed on a data display section of the mobile radio terminal but no voice communication being executed;

(b) upon detection of the operation in step (a), executing a call-out process for establishing voice communication with respect to a destination terminal that is identified by said telephone number information; and

(c) while at least one of said executing of the call-out process in step (b) and executing voice communication with the destination terminal, controlling the data display section to provide in a combination display state in which the data display section displays in combination at least a part of the data having the hyperlink and a calling-out state.
